

TASK-1

Student Registration & Data Storage

Aim

To design a Student Registration Form using HTML5 and CSS3, collect student details (Name, Email, DOB, Department, Phone), store them in a database, and retrieve the stored data using an SQL SELECT query.

Algorithm

1. Start
2. Create an HTML form to collect student details (Name, Email, DOB, Department, Phone).
3. Apply CSS3 styling for styling the form.
4. Create a database and a table to store student records.
5. Connect the HTML form to a backend (PHP).
6. Insert the submitted form data into the database.
7. Execute SQL SELECT query to retrieve stored data.
8. Display the retrieved data in tabular format.
9. Stop

Program

HTML & CSS Code:

```
<!DOCTYPE html>

<html>

<head>

<title>Student Registration</title>

<style>

body {

font-family: Arial;
```

```
background-color: #f2f2f2;

}

.form-container {

width: 400px;

margin: auto;

padding: 20px;

background: white;

border-radius: 10px;

box-shadow: 0px 0px 10px gray;

}

input, select {

width: 100%;

padding: 8px;

margin: 10px 0;

}

button {

width: 100%;

padding: 10px;

background-color: blue;

color: white;

border: none;

}

</style>
```

```
</head>

<body>

<div class="form-container">

<h2>Student Registration</h2>

<form action="insert.php" method="post">

<input type="text" name="name" placeholder="Name" required>

<input type="email" name="email" placeholder="Email" required>

<input type="date" name="dob" required>

<select name="department">

<option>CSE</option>

<option>ECE</option>

<option>EEE</option>

<option>IT</option>

</select>

<input type="text" name="phone" placeholder="Phone" required>

<button type="submit">Register</button>

</form>

</div>

</body>

</html>
```

PHP Code (insert.php):

```
<?php
```

```

$conn = new mysqli("localhost", "root", "", "student_db");

if ($conn->connect_error) {
    die("Connection failed: " . $conn->connect_error);
}

$name = $_POST['name'];
$email = $_POST['email'];
$dob = $_POST['dob'];
$dept = $_POST['department'];
$phone = $_POST['phone'];

$sql = "INSERT INTO students (name, email, dob, department, phone)
VALUES ('$name', '$email', '$dob', '$dept', '$phone')";

if ($conn->query($sql) === TRUE) {
    echo "Data inserted successfully";
} else {
    echo "Error: " . $conn->error;
}

$conn->close();
?>

```

PHP code (Retreive data):

```
<?php
```

```
$conn = new mysqli("localhost", "root", "", "student_db");
```

```
$sql = "SELECT * FROM students";
```

```
$result = $conn->query($sql);
```

```
echo "<table border='1'>
```

```
<tr>
```

```
<th>ID</th>
```

```
<th>Name</th>
```

```
<th>Email</th>
```

```
<th>DOB</th>
```

```
<th>Department</th>
```

```
<th>Phone</th>
```

```
</tr>";
```

```
while($row = $result->fetch_assoc()) {
```

```
    echo "<tr>
```

```
    <td>".$row["id"]."</td>
```

```
    <td>".$row["name"]."</td>
```

```
    <td>".$row["email"]."</td>
```

```
    <td>".$row["dob"]."</td>
```

```
    <td>".$row["department"]."</td>
```

```
    <td>".$row["phone"]."</td>
```

```
    </tr>";
```

```
}
```

```
echo "</table>";
```

```
$conn->close();
```

```
?>
```

SQL Table:

```
CREATE DATABASE student_db;
```

```
USE student_db;
```

```
CREATE TABLE students (  
    id INT AUTO_INCREMENT PRIMARY KEY,  
    name VARCHAR(100),  
    email VARCHAR(100),  
    dob DATE,  
    department VARCHAR(50),  
    phone VARCHAR(15)  
);
```

OUTPUT:

Student Registration

Select Department

▼

Register

[View Students](#)

Student Records

ID	Name	Email	DOB	Department	Phone
1	myth	myth54@gmail.com	2026-04-13	CSE	7766456521

Result

Thus, the Student Registration Form was successfully created using HTML5 and CSS3. The user inputs stored in database. The entered data was stored in the database and retrieved using SQL SELECT query.
